

In reference to Broadband internet over utility lines: I am in support of ventures that would allow competition for internet access - but NOT if there is a chance of it interfering at all with radio communications (as in HAM Radio). These raio communications are needed in times of emergency, yeah even in Presidentially declared emergencies there could be interuption to services needed to protect and serve our nation - just because someone wants to search the web - a non critical action.

I ask that the FCC and the appropriate committees or members seriously look into and conduct investigations of current systems and the interference and useage patterns that result from them before encouraging or allowing future expansion of broadband over powerlines.

Thank you for your time.
